The "Long Tail" of Circulation

Based on these unique findings, we argue that consideration in science communication on social media needs to be made in terms of not only thinking about the immediate production, but also the long-term, long tail of prevailing value such work has on a viewer long after an initial view. This perspective adds to existing scholarship on practical production and engagement recommendations for science communication. It also extends the conversation when thinking about its long-term potential. Both are important elements to contribute to in today's fast-paced (social) media landscape. Moreover, this might help highlight how digital media provide opportunities like opening up access to scientific sources, new ways and spaces to communicate and interact, and a potential to diversify who are involved and engage in science communication (Fahnrich, qtd. in Young et al.).
